

ERRATA SHEET

This errata sheet presents, in ~~strike-through~~ and double-underline format, the revisions to the Initial Study/Mitigated Negative Declaration (IS/MND) for the Sand Creek Sports Complex Project (proposed project). The revisions to the IS/MND reflected in this errata sheet do not affect the adequacy of the previous environmental analysis contained in the IS/MND. Because the changes presented below would not result in any new significant impacts or a substantial increase in the severity of an environmental impact identified in the IS/MND, recirculation of the IS/MND is not required.

Based on the comments received during the public review period for the IS/MND, page 31 of the IS/MND is hereby revised as follows:

Due to the lack of on-site trees, most raptors and migratory birds protected by the MBTA would not establish nests on-site. However, the potential exists for such species to establish nests in existing trees in the project vicinity and/or forage on-site. In addition, ground-nesting birds, such as killdeer and mourning dove, could nest within the on-site grassland and along the gravel/dirt shoulders of the paved Sand Creek Trail access road. Construction activities that adversely affect the nesting success of raptors and migratory birds (i.e., lead to the abandonment of active nests) or result in mortality of individual birds constitute a violation of State and federal laws. Thus, in the event that such species occur in the project site vicinity during the breeding season, or are foraging on-site, project construction activities could result in an adverse effect to species protected under the MBTA.

Based on the comments received during the public review period for the IS/MND, page 36 of the IS/MND is hereby revised as follows:

According to the BRA prepared for the proposed project, jurisdictional Waters of the U.S. or wetlands of any type are not present within the Phase 1 portion of the project site. Although the Basin IS/MND determined that the Phase 2 portion of the project site contained approximately 1.03 acres of seasonal wetlands, the Basin IS/MND concluded that implementation of mitigation would reduce impacts to wetlands to a less-than-significant level. Because the LSCB has already been developed, the proposed project is not anticipated to result in any additional impacts upon riparian habitats or wetlands within the Phase 2 portion of the project site.

Based on the comments received during the public review period for the IS/MND, Mitigation Measure VII-5 on page 47 of the IS/MND is hereby revised as follows:

VII-5. *Prior to grading permit issuance, the contractor shall submit an erosion control plan to the Director of Public Works/City Engineer for review and approval. The plan shall identify protective measures to be taken during construction, supplemental measures to be taken during the rainy season, the sequenced timing of grading and*

construction, and subsequent revegetation and landscaping work to ensure water quality in creeks and tributaries in the General Plan Area is not degraded from its present level. The plan shall specify that plastic monofilament netting shall not be used for erosion control matting; instead, the erosion control plan shall require the use of jute netting, coconut coir matting, or other natural alternatives. All protective measures shall be shown on the grading plans and specify the entity responsible for completing and/or monitoring the measure and include the circumstances and/or timing for implementation.

The aforementioned revisions are for clarification purposes only, and do not affect the conclusions of the IS/MND.
